Conclusion

The claims made by the researchers discussed above have shown that climate change has a negative impact on the American economy. These claims discuss why the United States government should fight against the causes and effects of climate change for the country’s economy. Additionally, moral foundations should be continually implemented to protect the environment. The effects climate change has on the economy can be mitigated with the help of government intervention, thus enabling a stronger and more environmentally-conscious economy.

Furthermore, the following call to action section states various mechanisms which should be considered by the United States government to prevent further damage caused by the climate in its economy. The United States government has to establish an effective approach to prevent the causes and impacts of climate change in the country, particularly in its most vulnerable areas. Moreover, this research provides an opportunity for other researchers to carry out various matters on the topic addressed in this essay.

Call to Action

The United States and other countries throughout the globe should advocate for green energy. There is a need to advise individuals why the adaptation of green energy is important as an environmental conservation process, and its core benefit is the reduction of climate change impact on the global economy (Houser at al.). This approach can be supported by different countries in many ways. First, they can avail alternative sources of energy to people, including hydropower, solar power, and wind power. Secondly, by making sure that green energy substitutes are available and

Is Climate Change a Big Risk to the United States’ Economy?

affordable. Thirdly, they can insist on the construction of modern buildings with green energy alternatives to protect the natural landscape (Houser at al.).

Additionally, the government can set targets to reduce the rising levels of Carbon Dioxide to lessen the effects of global warming. The United States, and other countries, have to reduce CO2 discharge by 30% to eliminate the risk of climate change on their economies. They also have to increase the use of renewable energy by 15% in a specific timeframe (Houser at al.). Also, this step calls upon countries to increase forest coverage from 1.1 million hectares to 50 million hectares by 2045 (United Nations Framework Convention on Climate Change).

The United States should implement strict laws that aid in achieving carbon neutrality. Adapting strict rules and regulations that punish companies, individuals, and countries involved in polluting the environment, will prevent further damage. For instance, International Environmental Law (public international laws) should enforce heavy fines on companies attempting to pollute and deplete the natural resources that have a big impact on climate change (United Nations Framework Convention on Climate Change).
